

Pregnancy Nutrition Knowledge Guide

Nutrition, micronutrients, food safety, hydration, weight gain, and common concerns during pregnancy.

RAG test dataset: Synthetic educational content for testing extraction, chunking, embeddings, retrieval and grounded answers. Not individualized medical advice.

1. Nutrition During Pregnancy

Pregnancy increases nutritional demands because nutrients support maternal tissues, placental function, fetal growth, and preparation for breastfeeding.

Needs vary with pregnancy stage, pre-pregnancy nutritional status, activity, health conditions, and local dietary patterns.

2. Energy and Protein

Energy needs do not simply double during pregnancy; additional needs vary by trimester and individual circumstances.

Protein foods can include eggs, fish, poultry, meat, dairy, legumes, beans, lentils, tofu, nuts, and seeds.

WHO recommends nutrition education on increasing daily energy and protein intake in undernourished populations as a context-specific intervention.

3. Micronutrients

Pregnancy nutrition includes attention to iron, folate, iodine, vitamin D, calcium, and other micronutrients.

Supplement type, dose, timing, and formulation should be individualized using qualified clinical or national guidance.

4. Food Safety

Pregnant people should take particular care with food hygiene and safe preparation because some foodborne infections can have serious consequences during pregnancy.

Wash produce, separate raw and cooked foods, cook foods appropriately, and follow current local food-safety guidance.

5. Hydration and Weight

Water is a practical primary beverage; individual fluid needs vary. Alcohol should be avoided during pregnancy.

Healthy pregnancy weight gain relates to pre-pregnancy nutritional status and should not use one target for everyone.

6. Common Concerns

Nausea, vomiting, constipation, heartburn, and appetite changes can affect food intake.

Persistent vomiting, inability to keep fluids down, dehydration, severe abdominal pain, bleeding, or other concerning symptoms require medical evaluation.

RAG Test Questions

- Does energy need to double during pregnancy?
- What protein foods are listed?
- Which micronutrients are highlighted?
- Why should supplement doses be individualized?
- What does the document say about alcohol?
- Why should weight-gain targets be individualized?
- Which symptoms require medical evaluation?

Unknown / Out-of-Scope Questions

- What exact prenatal vitamin brand should everyone take?
- What medication cures morning sickness?
- Can this document diagnose gestational diabetes?
- What will the baby's exact birth weight be?

Source / Scope Note

Based on WHO antenatal-care and pregnancy-nutrition guidance.
